EE 457 - Homework 4

Due 05/05/2017

Problem 1 The objective of this problem is to implement and evaluate the performance of several iterative algorithms for the Powell function

$$f(x) = (x_1 + 10x_2)^2 + 5(x_3 - x_4)^2 + (x_2 - 2x_3)^4 + 10(x_1 - x_4)^4$$

with the initial condition $x^{(0)} = [3, -1, 0, 1]^T$ and termination criteria k > 1000.

- (i) Implement in MATLAB the conjugate gradient algorithm. Plot $x_1^{(k)}$, $x_2^{(k)}$, $x_3^{(k)}$, $x_4^{(k)}$ and $f(x^{(k)})$ vs k.
- (ii) Implement in MATLAB the rank one correction algorithm. Plot $x_1^{(k)}$, $x_2^{(k)}$, $x_3^{(k)}$, $x_4^{(k)}$ and $f(x^{(k)})$ vs k.
- (iii) Implement in MATLAB the DFP algorithm. Plot $x_1^{(k)}$, $x_2^{(k)}$, $x_3^{(k)}$, $x_4^{(k)}$ and $f(x^{(k)})$ vs k.
- (iv) Implement in MATLAB the BFGS algorithm. Plot $x_1^{(k)}, x_2^{(k)}, x_3^{(k)}, x_4^{(k)}$ and $f(x^{(k)})$ vs k
- (v) Compare the results of the algorithms employed in (i)-(iv).

Problem 2 Write MATLAB programs to implement naive random search and simulated annealing. Use the neighborhood

$$N(x^{(k)}) = \{x : x_i^{(k)} - \alpha \le x_i \le x_i^{(k)} + \alpha \}$$

where $\alpha > 0$ is pre-specified, and pick $z^{(k)}$ to be uniformly distributed on $N(x^{(k)})$. Test both algorithms on minimizing the Powell function in Problem 1 for $\alpha = 0.001$ and $\alpha = 0.01$.

Problem 3 Consider the data for USD/TL parity given in Table 1. Let (t_i, y_i) represent the data points for i = 1, ..., 25. The objective is determine the best fitting line y = mt + c to minimize

$$f(m,c) = \frac{1}{2} \sum_{i=5}^{N} (mt_i + c - y_i)^2$$
 (0.1)

(i) Implement in MATLAB the recursive least squares algorithm starting with the initial two data points and using two weeks data at each iteration. Plot $m^{(k)}$, $c^{(k)}$ and $f(m^{(k)}, c^{(k)})$ vs k.

Table 1: USD/TL data

20-11-2015	2.86638
27-11-2015	2.85595

(ii) Implement in MATLAB the least squares solution using all data points. Compare the results obtained with those in (i).

Problem 4 Consider the measurement data given in Table 2 where (t_i, y_i) represent the data points for i = 1, ..., 26. The objective is determine the best fitting sine curve $y = A \sin(\omega t + \phi)$ to minimize

$$\sum_{i=1}^{26} (y_i - A\sin(\omega t_i + \phi))^2$$
 (0.2)

- (i) Implement in MATLAB the Gauss-Newton algorithm to determine the sinusoid of best fit.
- (ii) Implement in MATLAB the Levenberg-Marquardt algorithm to determine the sinusoid of best fit. Compare the result with the one in (i).

Table 2: Measurement data

$\begin{array}{c cccc} t_i & y_i \\ 0 & 0.9783 \\ \hline 0.4000 & 1.4617 \\ 0.8000 & 2.0580 \\ \hline 1.2000 & 2.0265 \\ \hline 1.6000 & 2.2238 \\ \hline 2.0000 & 1.5446 \\ \hline 2.4000 & 1.0970 \\ \hline 2.8000 & 0.2566 \\ \hline 3.2000 & -0.5050 \\ \hline 3.6000 & -0.8899 \\ \hline 4.0000 & -1.5676 \\ \hline 4.4000 & -2.1563 \\ \hline 4.8000 & -1.9748 \\ \hline 5.2000 & -2.2858 \\ \hline 5.6000 & -1.0813 \\ \hline 6.4000 & -0.1376 \\ \hline 6.8000 & 0.6637 \\ \hline 7.2000 & 1.0799 \\ \hline 7.6000 & 1.7931 \\ \hline 8.0000 & 2.2608 \\ \hline \end{array}$
